Agenda

Our PaaS Database Strategy Goes Something Like This...

NoSQL, Datastructures,
and Relational

Introduction to Cosmos DB

Creating and using our
Cosmos DB container

Partitioning, Indexing,
and Geo-Replication

Azure Cosmos DB customers

History of NoSQL

Relational Database Management Systems

- Enforced Schema and types
- Complex relationships
- Designed for correctness (not scale)
- Over normalized

Mark Broadbent
7 Nutbush CityLimits
Camblewick Green

Customer ID: 001111

Order ID: 00319

001031	SSD Drive	1	£210.00
021062	Memory DIMMs	2	£288.70
109575	Intel I5-3470	1	£151.00
			£649.70

Delivery Details:
Pilkington Electronics
18 Gervais Close

Customers Table				
CustID	First	Last	AddressLine1	AddressLine2
001111	Mark	Broadbent	7 Nutbush CityLimits	Camblewick Green
.....
.....
.....

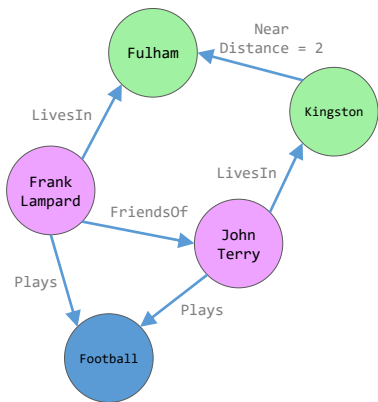

Orders Table	
OrderID	CustID
00319	001111
.....
.....

OrderDetails Table			
OrderID	CustID	ItemID	LineItem
00319	001111	001031	1
00319	001111	021062	2
00319	001111	109575	3
.....
.....

Stockitems Table		
ItemID	Description	StockLevel
001031	SSD Drive	110
.....
021062	Memory DIMMs	50
.....
109575	Intel I5-3470	12

What is NoSQL?

- “Not only” SQL
- Schema-less datasets
- Designed for scale
- No-Normalization

CustID	FirstName	LastName
001111	Mark	Broadbent
021567	Fred	Titmus
069974	Frank	Lampard

    }
  ]
}
```

Demo

Create our first Cosmos DB account

What is Cosmos DB?

SQL

Table API

Key-value

Column-family

Document

Graph

Elastic scale out
of storage & throughput

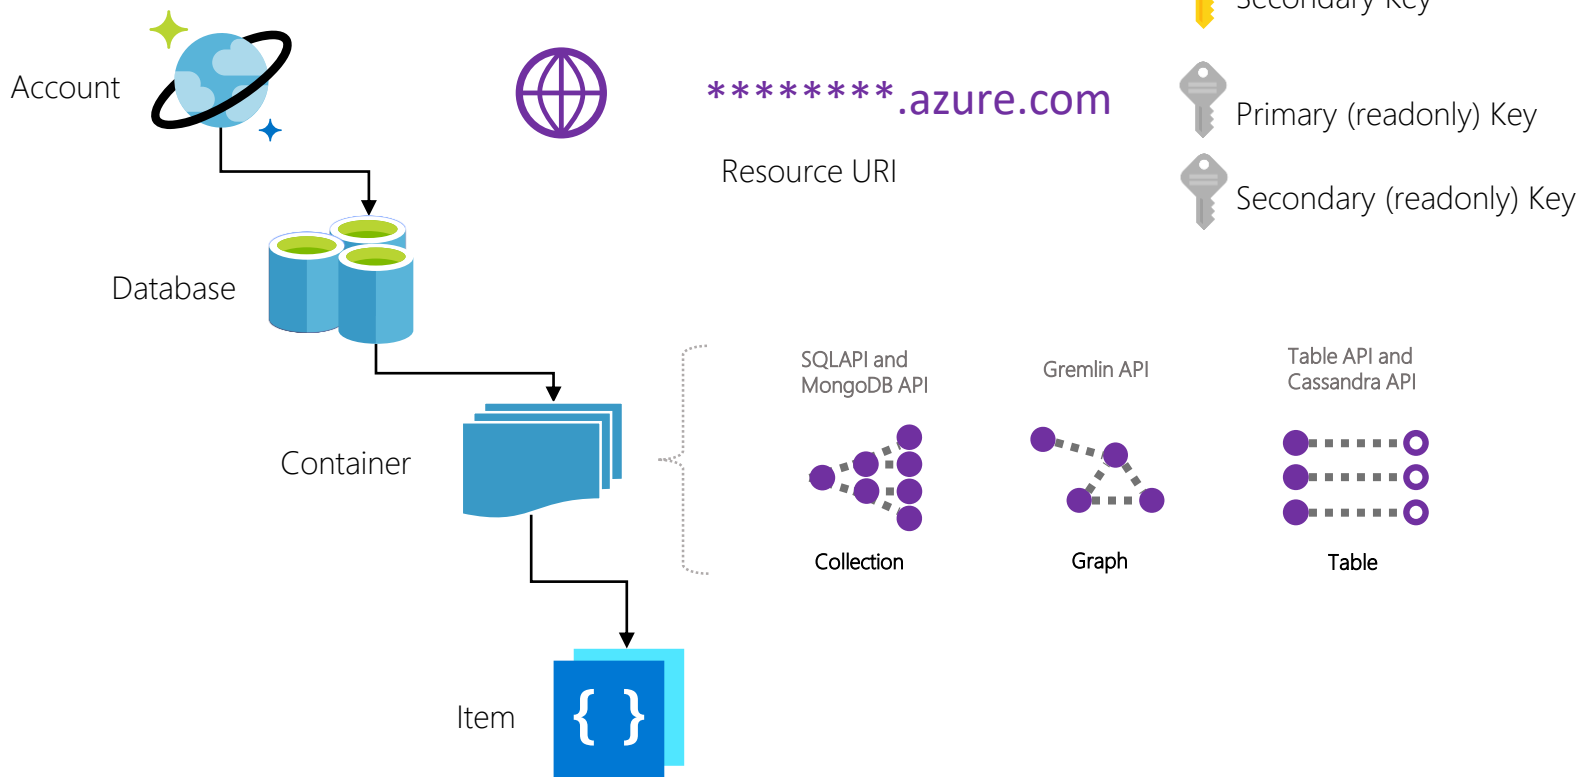

Guaranteed low latency at the 99th percentile

Five well-defined consistency models

Turnkey global distribution

Comprehensive SLAs

Resource Model Hierarchy

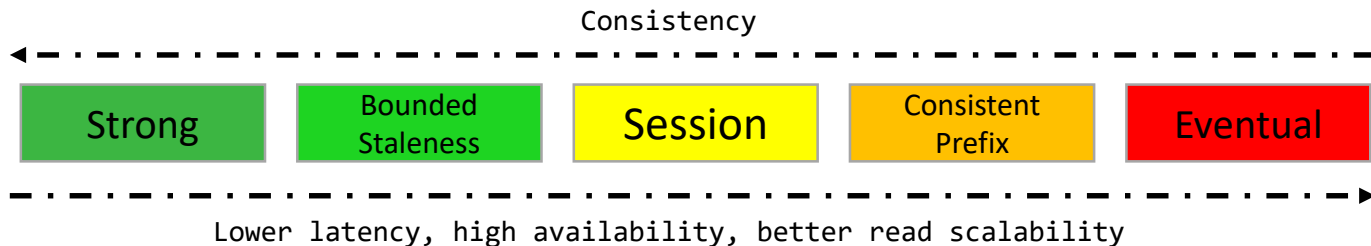

Demo

Creating SQL API containers and Querying data

Consistency

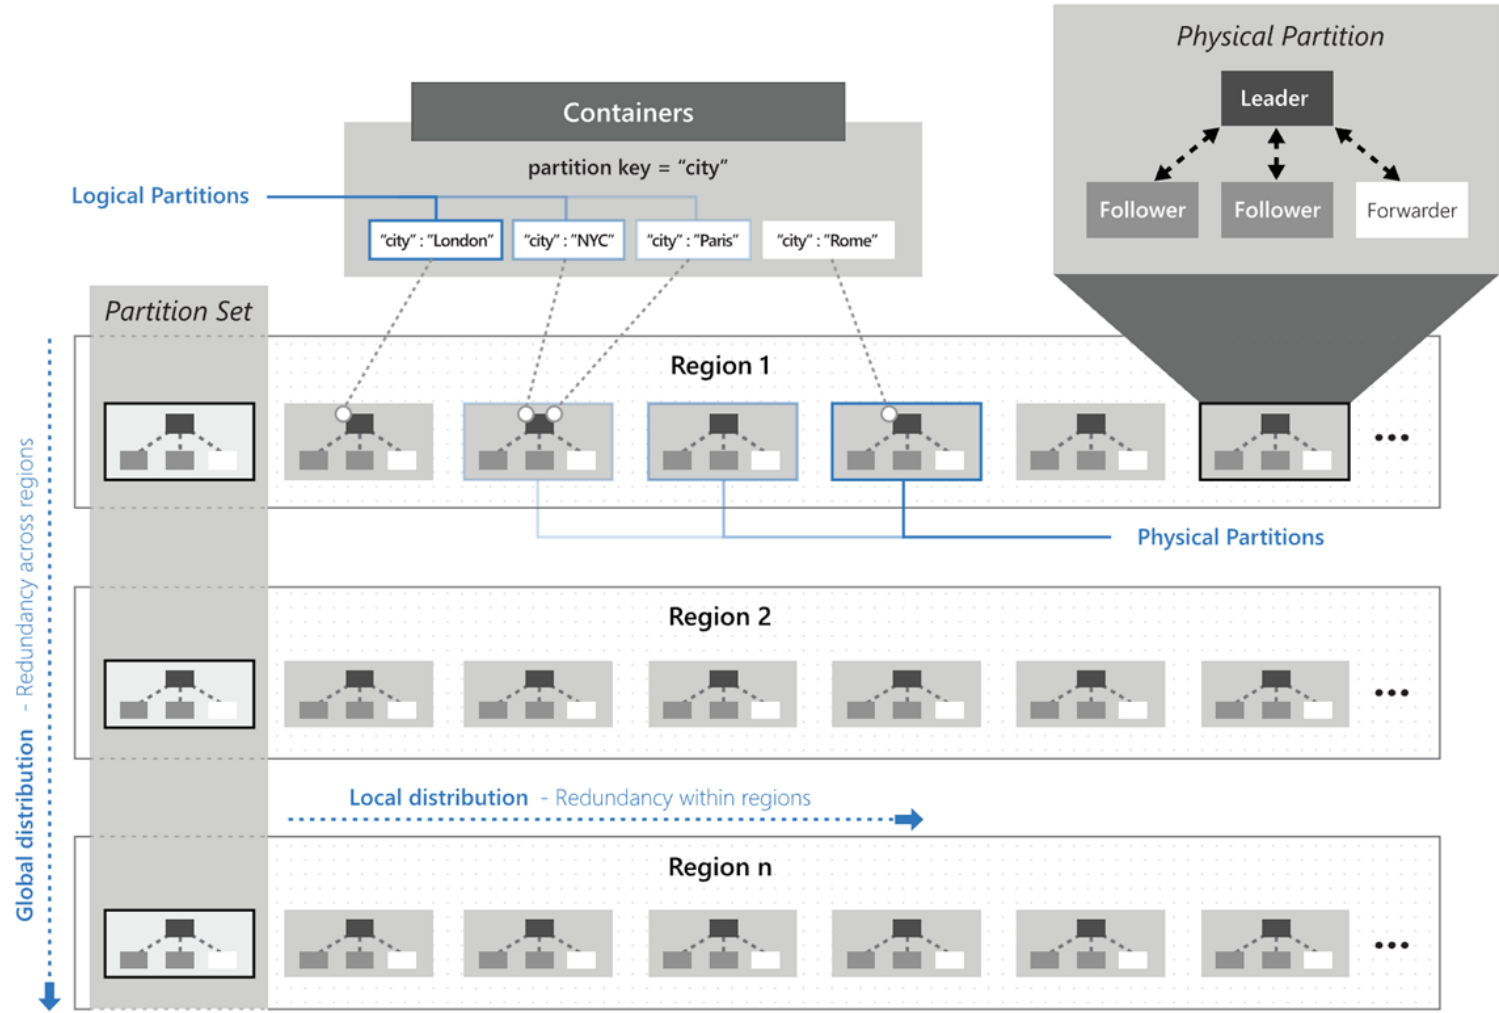

- Consistency Models are:
 - Strong – committed results visible to all partitions in all regions
 - Bounded Staleness – ordered changes but data stale only by k prefixes or t interval
 - Session – ordered changes and session writes visible immediately within the session, but may be stale outside of session
 - Consistent Prefix – ordered changes, but reads may be stale
 - Eventual – stale reads and possible out of order

- Multi-master replicas introduce lost update problem
- Protect your writes using the **_etag** document property

Demo

Consistency Concerns Exist In All DBs – Read Consistency and Lost Updates

Schema-agnostic, automatic indexing

At global scale, schema/index management is painful

Automatic and synchronous indexing

Hash, range, and geospatial

Works across every data model

Highly write-optimized database engine

Demo

Indexing

Global Replication, Database-Multi Master

In Summary...

- Use whatever works for you – **there is no battle between NoSQL and SQL**
- Cosmos DB is Microsoft's multi-model NoSQL PaaS db providing many benefits:
 - [99.999% availability, throughput and consistency SLAs](#)
 - Global read AND write scale
 - Automatic Indexing and Partitioning
- Is a great choice for:
 - Migrating on-premises workloads (particularly open source NoSQL offerings)
 - Data Science exploration or Kubernetes persisted data store
 - Global retailers AND small NoSQL deployments.

However...

- Has some quirks/ annoyances (hopefully some will be addressed)
 - Database/ Container sizing quirk
 - Container partition key immutable (and case sensitive)
 - Inability to swap API.
- Requires a change in mindset when thinking about
 - The data model and constraints
 - Administration and Development.

Thank you for listening!
